## **Appendix G**

## **UNIFAC Method**

The UNIQUAC equation<sup>1</sup> treats  $g \equiv G^E/RT$  as the sum of two parts, a *combinatorial* term  $g^C$  to account for molecular size and shape differences, and a *residual* term  $g^R$  (not a residual property as defined in Sec. 6.2) to account for molecular interactions:

$$g \equiv g^C + g^R \tag{G.1}$$

Function  $g^C$  contains pure-species parameters only, whereas function  $g^R$  incorporates two binary parameters for each pair of molecules. For a multicomponent system,

$$g^{C} = \sum_{i} x_{i} \ln \frac{\Phi_{i}}{x_{i}} + 5 \sum_{i} q_{i} x_{i} \ln \frac{\theta_{i}}{\Phi_{i}}$$
 (G.2)

$$g^{R} = -\sum_{i} q_{i} x_{i} \ln \left( \sum_{j} \theta_{j} \tau_{ji} \right)$$
 (G.3)

where

$$\Phi_i \equiv \frac{x_i r_i}{\sum_i x_j r_j} \tag{G.4}$$

$$\theta_i \equiv \frac{x_i q_i}{\sum_j x_j q_j} \tag{G.5}$$

Subscript i identifies species, and j is a dummy index; all summations are over all species. Note that  $\tau_{ji} \neq \tau_{ij}$ ; however, when i = j, then  $\tau_{ii} = \tau_{jj} = 1$ . In these equations  $r_i$  (a relative molecular volume) and  $q_i$  (a relative molecular surface area) are pure-species parameters. The influence of temperature on g enters through the interaction parameters  $\tau_{ji}$  of Eq. (G.3), which are temperature dependent:

$$\tau_{ji} = \exp\frac{-\left(u_{ji} - u_{ii}\right)}{RT} \tag{G.6}$$

Parameters for the UNIQUAC equation are therefore values of  $(u_{ji} - u_{ii})$ .

<sup>1</sup>D. S. Abrams and J. M. Prausnitz, AIChE J., vol. 21, pp. 116-128, 1975.

An expression for  $\ln \gamma_i$  is found by application of Eq. (13.7) to the UNIOUAC equation for g [Eqs.(G.1) through (G.3)]. The result is given by the following equations:

$$\ln \gamma_i = \ln \gamma_i^C + \ln \gamma_i^R \tag{G.7}$$

$$\ln \gamma_i^C = 1 - J_i + \ln J_i - 5q_i \left( 1 - \frac{J_i}{L_i} + \ln \frac{J_i}{L_i} \right)$$
 (G.8)

$$\ln \gamma_i^R = q_i \left( 1 - \ln s_i - \sum_j \theta_j \frac{\tau_{ij}}{s_j} \right)$$
 (G.9)

where in addition to Eqs. (G.5) and (G.6),

$$J_{i} = \frac{r_{i}}{\sum_{j} r_{j} x_{j}}$$

$$L_{i} = \frac{q_{i}}{\sum_{j} q_{j} x_{j}}$$
(G.10)

$$L_i = \frac{q_i}{\sum_j q_j x_j} \tag{G.11}$$

$$S_i = \tau_{li} \sum_{l} \theta_l \tag{G.12}$$

Again subscript i identifies species, and j and l are dummy indices. All summations are over all species, and  $\tau_{ij} = 1$  for i = j. Values for the parameters  $(u_{ii} - u_{ji})$  are found by regression of binary VLE data and are given by Gmehling et al.<sup>2</sup>

The UNIFAC method for estimation of activity coefficients<sup>3</sup> depends on the concept that a liquid mixture may be considered a solution of the structural units from which the molecules are formed rather than a solution of the molecules themselves. These structural units are called subgroups, and a few of them are listed in the second column of Table G.1. A number, designated k, identifies each subgroup. The relative volume  $R_k$  and relative surface area  $Q_k$ are properties of the subgroups, and values are listed in columns 4 and 5 of Table G.1. Also shown (columns 6 and 7) are examples of molecular species and their constituent subgroups. When a molecule can be constructed from more than one set of subgroups, the set containing the least number of different subgroups is the correct set. The great advantage of the UNIFAC method is that a relatively small number of subgroups combine to form a very large number of molecules.

Activity coefficients depend not only on the subgroup properties  $R_k$  and  $Q_k$ , but also on interactions between subgroups. Here, similar subgroups are assigned to a main group, as shown in the first two columns of Table G.1. The designations of main groups, such as "CH2," "ACH," etc., are descriptive only. All subgroups belonging to the same main group are

considered identical with respect to group interactions. Therefore parameters characterizing group interactions are identified with pairs of *main* groups. Parameter values  $a_{mk}$  for a few such pairs are given in Table G.2.

The UNIFAC method is based on the UNIQUAC equation, for which the activity coefficients are given by Eq. (G.7). When applied to a solution of groups, Eqs. (G.8) and (G.9) are written:

$$\ln \gamma_i^C = 1 - J_i + \ln J_i - 5q_i \left( 1 - \frac{J_i}{L_i} + \ln \frac{J_i}{L_i} \right)$$
 (G.13)

$$\ln \gamma_i^R = q_i \left[ 1 - \sum_k \left( \theta_k \frac{\beta_{ik}}{s_k} - e_{ki} \ln \frac{\beta_{ik}}{s_k} \right) \right]$$
 (G.14)

<sup>&</sup>lt;sup>†</sup>H. K. Hansen, P. Rasmussen, Aa. Fredenslund, M. Schiller, and J. Gmehling, IEC Research, vol. 30, pp. 2352–2355, 1991.

The quantities J and L are still given by Eqs. (G.10) and (G.11). In addition, the following definitions apply:

$$r_i = \sum_k v_k^{(i)} R_k \tag{G.15}$$

$$q_i = \sum_k v_k^{(i)} Q_k \tag{G.16}$$

$$e_{ki} = \frac{v_k^{(i)} Q_k}{q_i} \tag{G.17}$$

$$\beta_{ik} = \sum_{m} e_{mi} \tau_{mk} \tag{G.18}$$

$$\theta_k = \frac{\sum_i x_i q_i e_{ki}}{\sum_j x_j q_j} \tag{G.19}$$

$$s_k = \sum_m \theta_m \tau_{mk} \tag{G.20}$$

$$\tau_{mk} = \exp \frac{-a_{mk}}{T} \tag{G.21}$$

Subscript i identifies a species, and j is a dummy index running over all species. Subscript k identifies subgroups, and m is a dummy index running over all subgroups. The quantity  $v_k^{(i)}$  is the number of subgroups of type k in a molecule of species i. Values of the subgroup parameters  $R_k$  and  $Q_k$  and of the group interaction parameters  $a_{mk}$  come from tabulations in the literature. Tables G.1 and G.2 show a few parameter values; the number designations of the complete tables are retained.<sup>4</sup>

The equations for the UNIFAC method are presented here in a form convenient for computer programming. In the following example we run through a set of hand calculations to demonstrate their application.

## Example G.1

For the binary system diethylamine(1)/n-heptane(2) at 308.15 K, find  $\gamma_1$  and  $\gamma_2$  when  $x_1 = 0.4$  and  $x_2 = 0.6$ .

## Solution G.1

The subgroups involved are indicated by the chemical formulas:

$$CH_3 - CH_2NH - CH_2 - CH_3(1) / CH_3 - (CH_2)_5 - CH_3(2)$$

<sup>4</sup>H. K. Hansen, P. Rasmussen, Aa. Fredenslund, M. Schiller, and J. Gmehling, IEC Research, vol. 30, pp. 2352-2355, 1991.

The following table shows the subgroups, their identification numbers k, values of parameters  $R_k$  and  $Q_k$  (from Table G.1), and the numbers of each subgroup in each molecule:

	k	$R_k$	$Q_k$	$v_k^{(1)}$	$v_k^{(2)}$
CH <sub>3</sub>	1	0.9011	0.848	2	2
$CH_2$	2	0.6744	0.540	1	5
CH <sub>2</sub> NH	33	1.2070	0.936	1	0

By Eq. (G.15)

$$r_1 = (2)(0.9011) + (1)(0.6744) + (1)(1.2070) = 3.6836$$

Similarly,

$$r_2 = (2)(0.9011) + (5)(0.6744) = 5.1742$$

In like manner, by Eq. (G.16),

$$q_1 = 3.1720$$
 and  $q_2 = 4.3960$ 

The  $r_i$  and  $q_i$  values are molecular properties, independent of composition. Substituting known values into Eq. (G.17) generates the following table for  $e_{ki}$ :

	$e_{ki}$				
k	i = 1	i = 2			
1	0.5347	0.3858			
2	0.1702	0.6142			
33	0.2951	0.0000			

The following interaction parameters are found from Table G.2:

$$a_{1,1} = a_{1,2} = a_{2,1} = a_{2,2} = a_{33,33} = 0 \text{ K}$$
  
 $a_{1,33} = a_{2,33} = 255.7 \text{ K}$   
 $a_{33,1} = a_{33,2} = 65.33 \text{ K}$ 

Substitution of these values into Eq. (G.21) with T = 308.15 K gives

$$\tau_{1,1} = \tau_{1,2} = \tau_{2,1} = \tau_{2,2} = \tau_{33,33} = 1$$

$$\tau_{1,33} = \tau_{2,33} = 0.4361$$

$$\tau_{33,1} = \tau_{33,2} = 0.8090$$

Application of Eq. (G.18) leads to the values of  $\beta_{ik}$  in the following table:

	$eta_{ik}$					
i	k = 1	k = 2	k = 33			
1	0.9436	0.9436	0.6024			
2 .	1.0000	1.0000	0.4360			

Substitution of these results into Eq. (G.19) yields:

$$\theta_1 = 0.4342$$
  $\theta_2 = 0.4700$ 

$$\theta_2 = 0.4700$$

$$\theta_{33} = 0.0958$$

and by Eq. (G.20),

$$s_1 = 0.9817$$

$$s_2 = 0.9817$$

$$s_1 = 0.9817$$
  $s_2 = 0.9817$   $s_{33} = 0.4901$ 

The activity coefficients may now be calculated. By Eq. (G.13),

$$\ln \gamma_1^C = -0.0213$$

and 
$$\ln \gamma_2^C = -0.0076$$

and by Eq. (G.14),

$$\ln \gamma_1^R = 0.1463$$

and

$$\ln \gamma_2^R = 0.0537$$

Finally, Eq. (G.7) gives:

$$\gamma_1 = 1.133$$
 and  $\gamma_2 = 1.047$ 

$$\gamma_2 = 1.047$$
